

Business Problem Document

1. Background

The food service industry has experienced rapid growth in recent years, driven by changing consumer behavior, urban lifestyles, and increased smartphone penetration. Customers now expect convenience, speed, and transparency when ordering food. However, many small and medium-sized restaurants still rely on traditional phone-based ordering systems, which are inefficient and error-prone.

2. Current Situation (As-Is State)

Currently, customers place food orders by calling restaurants directly. Restaurant staff manually record orders, confirm availability verbally, and coordinate delivery without any centralized system. Payments are predominantly cash-based, and customers do not receive real-time updates on their orders.

Area	Current Approach	Challenges
Order Placement	Phone-based ordering	Miscommunication and order errors
Payment	Cash on delivery	No payment tracking or transparency
Order Tracking	Manual follow-up	No real-time status visibility
Scalability	Limited by staff availability	Cannot handle peak demand

3. Problem Statement

The absence of a centralized digital food ordering platform results in operational inefficiencies, frequent order errors, limited scalability, and poor customer experience. Restaurants struggle to manage increasing order volumes, while customers lack transparency and convenience during the ordering process.

4. Root Cause Analysis

Root Cause	Description	Impact
Manual Processes	Orders recorded manually via calls	High error rate
No Digital Platform	Lack of centralized system	Inefficient operations
Limited Technology Adoption	Restaurants not using automation	Poor scalability
No Real-Time Communication	No order status updates	Low customer satisfaction

5. Business Impact

These problems lead to lost revenue opportunities, dissatisfied customers, and operational stress for restaurants. Inconsistent order handling reduces repeat business and negatively impacts brand reputation. Over time, businesses that fail to digitize risk losing market share to technology-driven competitors.

6. Business Objectives

Objective ID	Objective Description	Success Measure
BO-01	Provide a digital platform for food ordering	Online order adoption rate
BO-02	Reduce order errors	Error reduction percentage
BO-03	Improve customer experience	Customer satisfaction rating
BO-04	Enable business scalability	Increase in order volume handling

7. Proposed Solution Overview

The proposed solution is an Online Food Delivery Platform that enables customers to browse restaurants, place orders digitally, make online payments, and track orders in real time. Restaurants will receive orders through a centralized dashboard, allowing efficient order management and improved service delivery.

8. Stakeholders

Stakeholder	Role	Interest
Business Sponsor	Project funding and approval	Return on investment
Restaurant Owners	Service providers	Operational efficiency
Customers	End users	Convenience and reliability
Business Analyst	Requirement analysis	Solution alignment
Technical Team	System development	Clear requirements

9. Conclusion

This business problem analysis establishes the need for a robust digital food ordering solution. Addressing the identified challenges will improve operational efficiency, enhance customer satisfaction, and support long-term business growth. This document serves as the foundation for detailed requirement analysis in subsequent phases.
