

## Diagrams with Theory – Online Food Delivery Platform

### Use Case Diagram

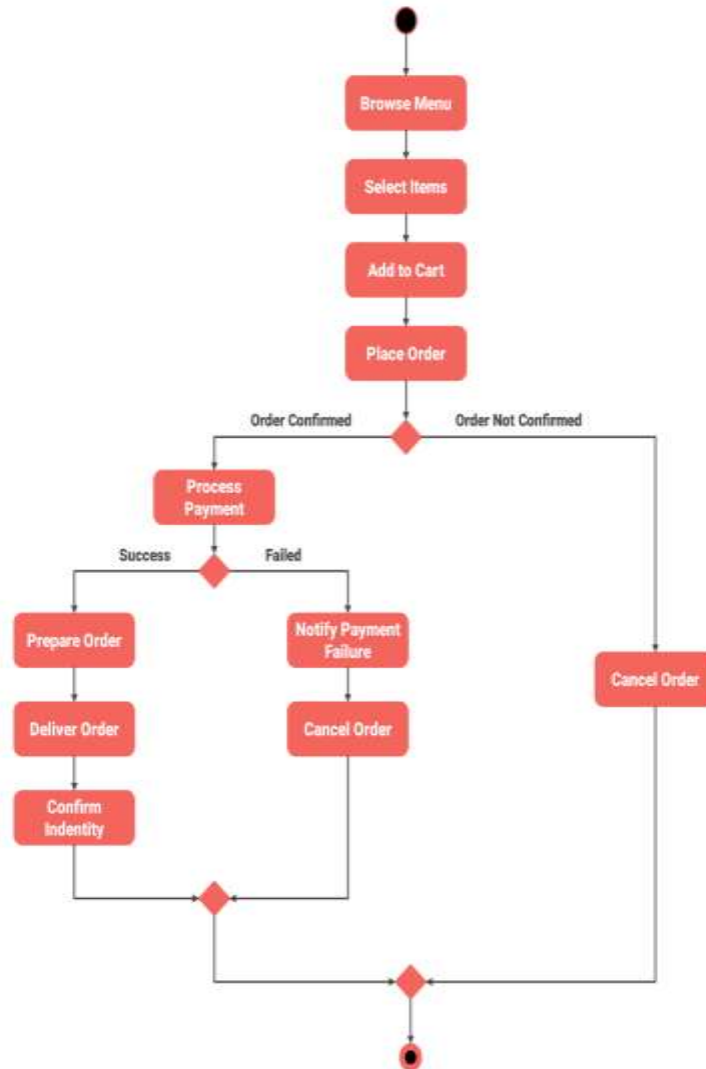

Represents key actors (Customer, Restaurant User, Admin) and their interactions with the Online Food Delivery Platform. It was used to define system scope and identify high-level business functionalities such as ordering, payment, and order management.

## Process Flow Diagram

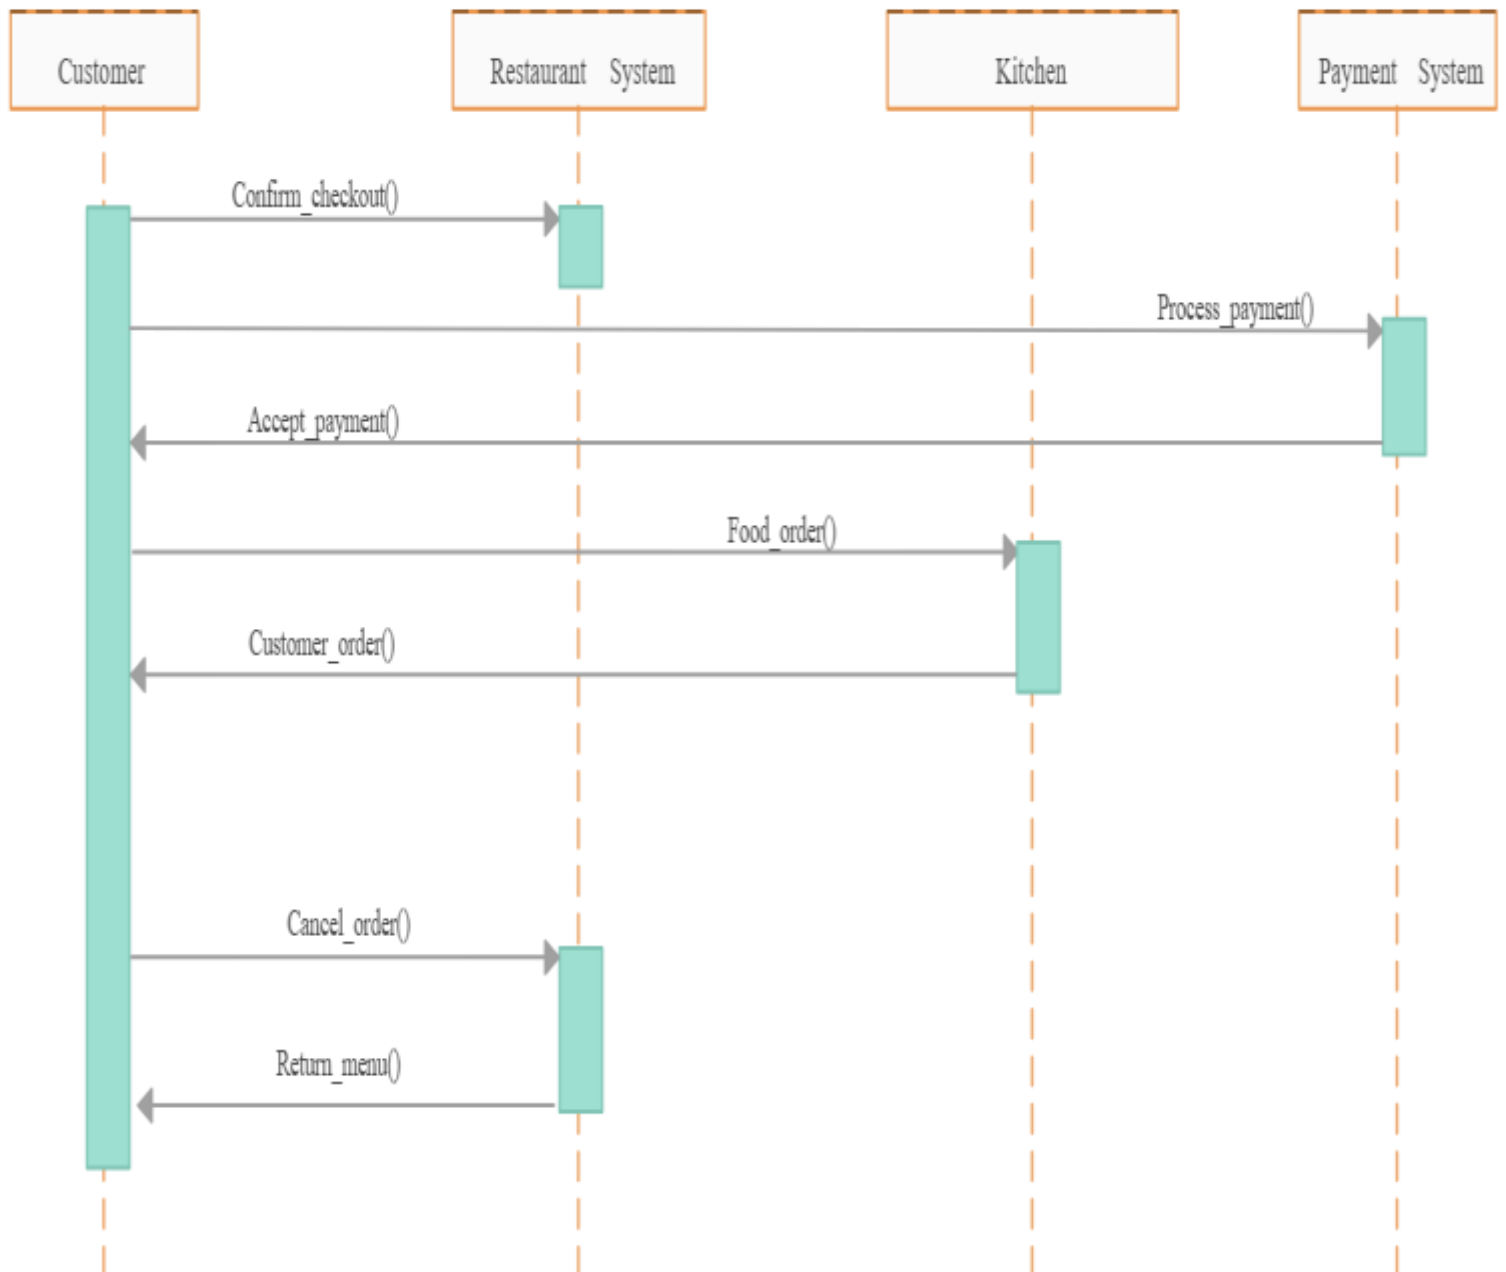

Illustrates the end-to-end digital food ordering process from order initiation to delivery. It helped analyze the TO-BE workflow, identify automation points, and remove inefficiencies from the manual AS-IS process.

## Activity Diagram

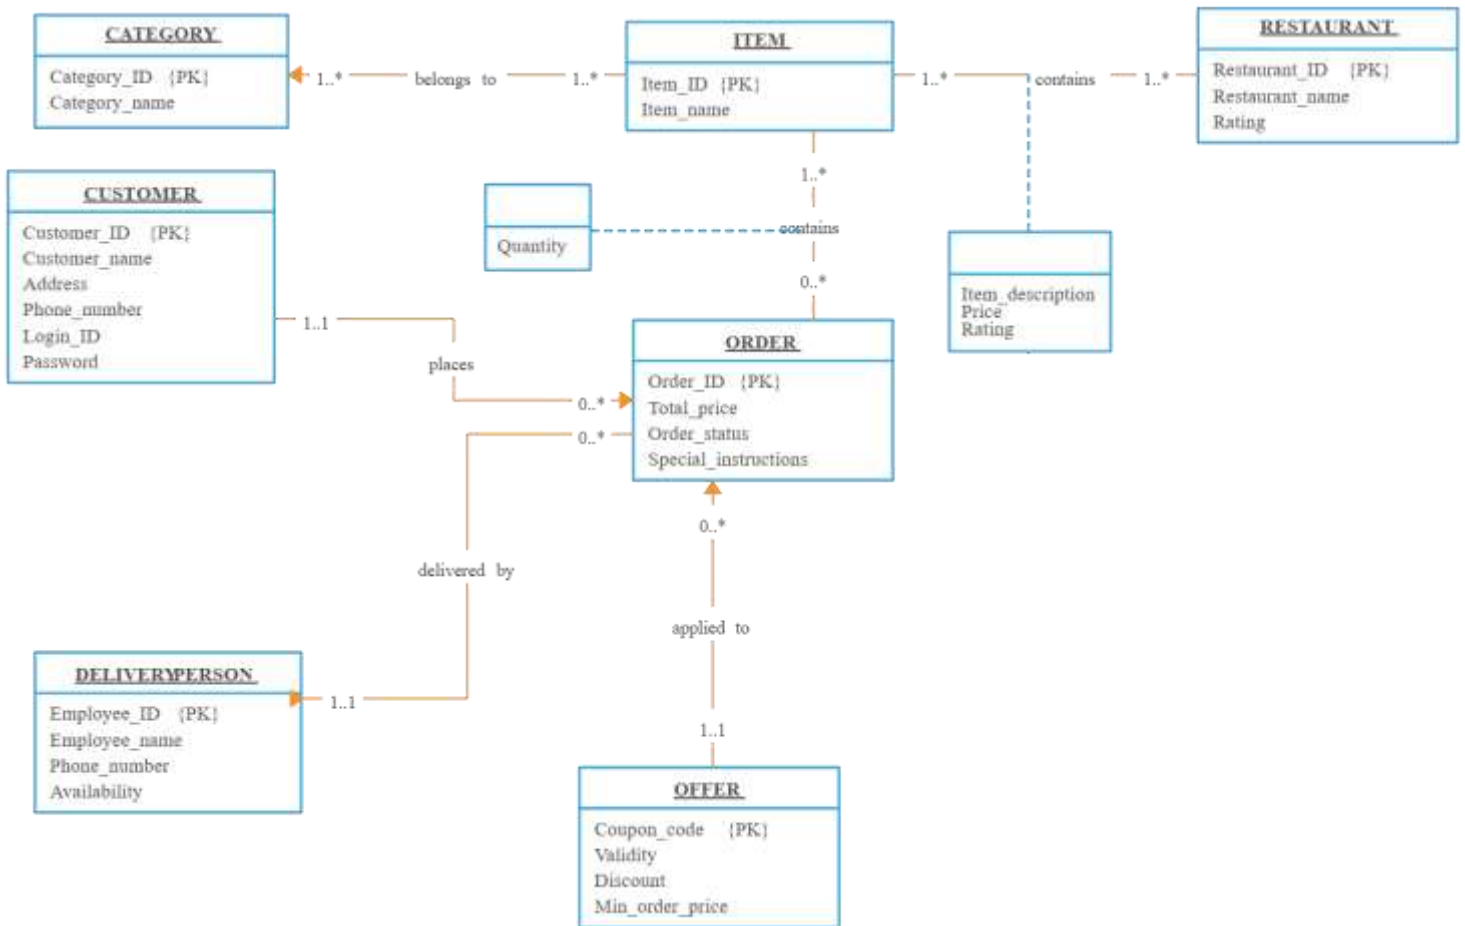

Shows the detailed workflow logic for order placement, including decision points like payment success or failure. It was used to clearly define business rules, alternate paths, and exception handling.

## Sequence Diagram

Depicts the interaction sequence between Customer, Application, Backend System, and Payment Gateway during order placement. It helped align system interactions and validate integration flow.

## Class Diagram

Defines core business entities such as User, Restaurant, Order, and Payment along with their relationships. It was used to support data requirements and ensure consistency between business and system design.
