

Process Flow Document

1. Purpose

This document illustrates the current (AS-IS) and proposed (TO-BE) process flows for the Online Food Delivery Platform. The objective is to highlight inefficiencies in the existing process and demonstrate improvements enabled through system implementation.

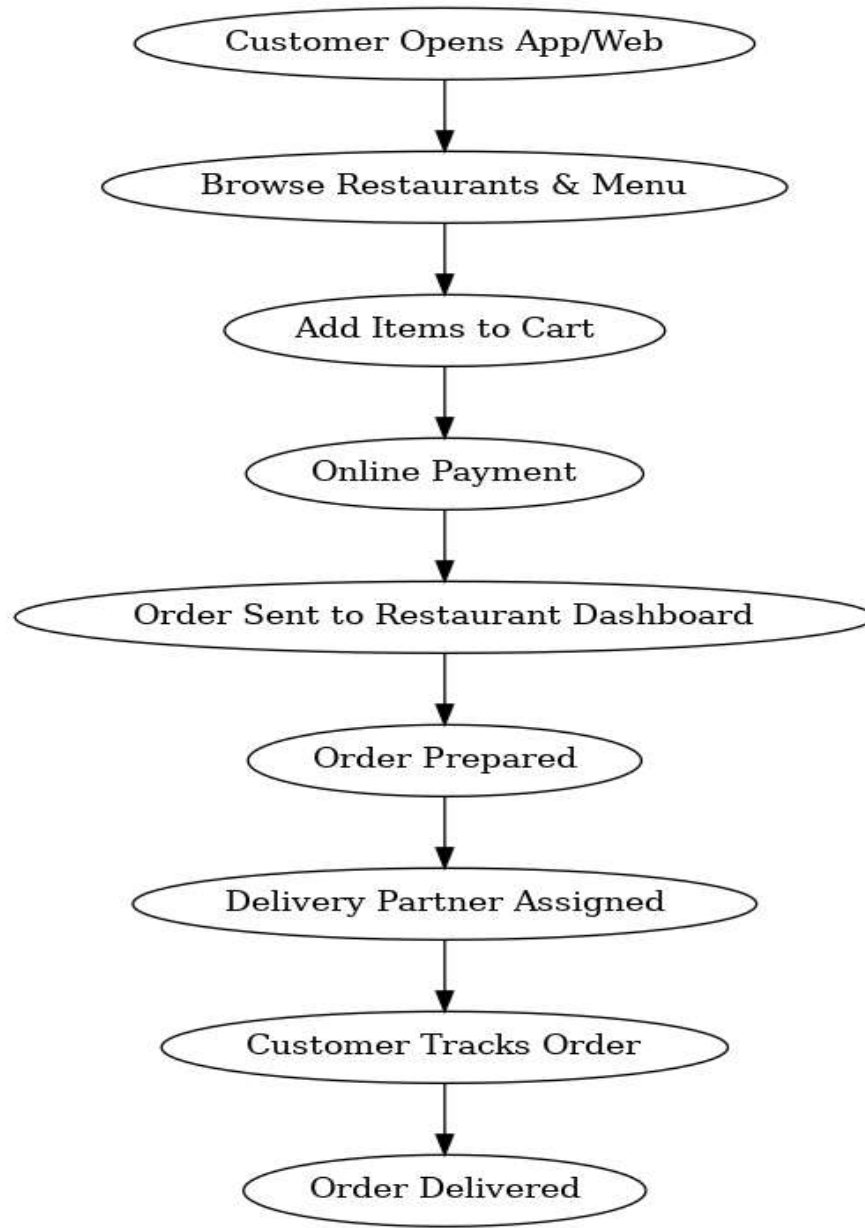

2. AS-IS Process Flow (Current State)

The AS-IS process represents the traditional phone-based food ordering system, which involves manual order taking, limited visibility, and high dependency on human coordination.

3. TO-BE Process Flow (Future State)

The TO-BE process represents the optimized digital ordering workflow enabled by the Online Food Delivery Platform, providing automation, transparency, and scalability.

4. Gap Analysis

Process Area	AS-IS Limitation	TO-BE Improvement
Order Placement	Manual phone calls	Online automated ordering
Payment	Cash only	Secure digital payments

Tracking	No visibility	Real-time order tracking
Scalability	Staff dependent	System-driven scalability

5. Process Improvement Summary

The TO-BE process significantly reduces manual intervention, minimizes errors, and enhances customer experience. It enables restaurants to handle higher order volumes efficiently and provides business stakeholders with better visibility and control.
